A clearer path to care across Altru

Prepared by Specbee for Altru | Executive brief | October 28, 2026

Suggested user flows based on Altru's existing design, provided solely for potential user-flow exploration. One Altru experience supports finding a person, learning about services and understanding the care available at nearby places.

Recommended UX direction

Find a person	One search accepts names, specialties or clinics. Known-doctor profiles feature the verified office phone; care locations remain secondary. Names stay searchable across communities.
Learn or find a provider	Services > Heart & Vascular Care > read the overview > Find a provider > matching results. Clinical topics are optional, with a separate information journey.
Browse care nearby	Care locations shows all care types at nearby places using an approximate IP estimate. Filtering is optional. This journey ends at local service details, without provider selection.
Start with a familiar place	Locations > clinic page > View providers. Location pages also support services, arrival information and Google Maps directions. Visitors can correct the estimated location or search without one.

Expected value

Visitors can reach their own endpoint without a forced provider step or required clinical-topic detour. The guide pairs hospital-site references with Altru examples. Benefits remain hypotheses for visitor testing.

What Altru needs to confirm

Validate the roster, names and aliases, office contacts, local capabilities, visiting patterns and source owners. Confirm IP estimation, manual override and fallback rules; configure TruSearch and test with representative visitors.

The seven guided journeys open paused; Play is optional. IP detection and calling are simulated. Incoming-region data remains anonymous and illustrative. Production integrations and clinical coverage require Altru validation. Scheduling remains in MyChart.
